

Operating Systems

Previous Year Questions - Semester V

Instructions:

1. Answer all five questions.
2. Each question carries ten marks.

Q1. What is a process? Explain the process state transition diagram with an example.

2. Define deadlock. State the four necessary conditions for its occurrence.

Question 3. Differentiate between paging and segmentation with suitable examples.

Question 4. Explain semaphores and their use in process synchronization.

5. A system has three processes and one semaphore initialized to zero. Describe what happens on every wait and signal operation.
